

Problem Statement 2 – Output Guidelines

Package: SG039C – Laparoscopic Cholecystectomy (Without Exploration of CBD)

Purpose of the Outputs

Participants must generate **two outputs for each claim**:

S. No.	Output
1	Structured, row-wise output capturing: • Objective interpretation of pre-procedure radiological image (USG Abdomen) • Correlation with written radiology report • Alignment with Cholecystectomy STG requirements • Stage and timeline awareness
2	Textual summary consolidating all structured outputs into a human-readable note suitable for PPD / CPD review, without making diagnostic, approval, or payment decisions

✦ **Note:** For laparoscopic cholecystectomy without CBD exploration, only pre-procedure imaging is expected. No post-procedure radiological image is mandated.

SECTION 1: Claim Details (1 column)

Claim No.

- **Description:** Unique identifier for the claim
- **Type:** String / Integer
- **Purpose:** Links image interpretation to the specific cholecystectomy claim

SECTION 2: Image Classification (1 column)

Type of Radiological Image – Pre-Procedure Stage

- **Description:** Imaging submitted at pre-authorization stage
- **Expected Values:**
 - “USG Abdomen”
 - “Absent”
- **Purpose:** Confirms submission of **mandatory ultrasound evidence for gall bladder disease** as per STG

SECTION 3: Pre-procedure Image Description – Hepatobiliary System (7 columns)

- ☒ Describe what is seen on ultrasound, not what it means clinically

These fields capture **objective, observable sonographic features** under the following **five mandatory columns**.

1. Liver: free-text, Sonographic appearance of the liver parenchyma

- Examples may include:
 - Normal
 - Hyperechoic liver
 - Not visualised
 - Partially visualised

2. Gall Bladder: free text, whether stones visualised and appearance of the gall bladder

- Expected observational entries may include:
 - GB normal
 - GB visualised poorly
 - Multiple stones present in GB
 - Single stone present in GB

3. Spleen: free-text, Sonographic appearance of spleen

- Examples may include:
 - Normal
 - Not visualised
 - Partially visualised

4. Kidneys: free-text, Visual appearance of kidneys

- Examples may include:
 - Normal
 - Not visualised
 - Partially visualised

5. Urinary Bladder: free-text, Sonographic appearance of urinary bladder

- Examples may include:
 - Normal
 - Not visualised
 - Partially visualised

6. Prostate / Uterus: free-text, Visualisation of prostate (if applicable) or uterus

- Examples may include:
 - Uterus normal
 - Uterus bulky
 - Prostate normal
 - Not visualised
- Note: Entry depends on what is visualised in the image; absence must be explicitly stated.

7. Peritoneal Fluid: free-text, Presence or absence of free fluid in peritoneal cavity

- Examples may include:
 - Not present
 - Minimal fluid seen
 - Not visualised

5. Pericholecystic Fluid / Surrounding Structures: free-text, Surrounding sonographic findings

- Examples may include:
 - No pericholecystic fluid seen
 - Minimal pericholecystic fluid seen
 - Not adequately visualised

 **Important:** CBD findings are recorded **only as observed**. No inference about exploration or obstruction should be made.

SECTION 4: Report Validity and Correlation (only for post-procedure stage in this package) (4 columns)

4A. Intra-Report Consistency

1. **Intra-Report Consistency Check:** : Whether the written report's observations and impression agree with each other; expected values -
 - Consistent
 - Partially supported
 - Unsupported
2. **Reason (Intra):** free-text, examples may include -
 - "Findings described support impression"
 - "Impression mentions stones but findings unclear"

4B. Image vs Written Report Correlation

3. **Image vs Report Correlation Outcome:** Whether image features support what the written report claims; expected values-
 - Consistent
 - Partially supported
 - Unsupported
4. **Reason (Inter):** Free text explaining support or mismatch, examples may include –
 - GB stones visualised in image but not mentioned in report
 - GB stones mentioned in report but not visualised in images

SECTION 5: Claim, Package & STG Alignment (overall) (4 columns)

5A. Claim and Package Alignment

1. **Alignment Category:** Expected values -
 - Pre-procedure investigations align
 - Pre-procedure investigations partially align
 - Pre-procedure investigations do not align
2. **Reason for Alignment / Non-Alignment:** free text, examples may include:
 - "Ultrasound demonstrates gallstones as required by STG"
 - "Gall bladder not adequately visualised"

5B. Investigation and STG Alignment

3. **STG Alignment Outcome:** Expected values -
 - Consistent
 - Partially supported
 - Unsupported
4. **Reason for Deviation (mapped to PPD logic):** Textual explanation mapped to PPD / CPD logic of STGs; examples may include:
 - "Stone visualisation unclear on ultrasound"
 - "Mandatory pre-procedure imaging absent"
 -

SECTION 6: Stage & Timeline Awareness (5 columns)

S. No.	Column	Description
1	Admission Date	DD/MM/YYYY
2	Pre-Procedure Investigation Date	DD/MM/YYYY
3	Post-Procedure Investigation Date	DD/MM/YYYY
4	Discharge Date	DD/MM/YYYY
5	Flag for one-month older documents for pre-procedure investigations	Yes / No

SECTION 7: Quality (1 column)

- **Description:** free text, image usability comment, examples may include:
 - Good enough for human eyes
 - Poor quality, artefacts present
 - Overexposed / underexposed

Summary PDF

- **Description:** Short human-readable case summary
- **Expected Content:**
 - Key image description summary
 - Report validity and correlation outcome
 - Package and STG alignment statement
 - Stage and timelines awareness summary of dates and flags
- **Tone:** Assistive, neutral, non-diagnostic

✓ Important Rules for Participants

- Use **observational language only**
- Do **not** confirm diagnoses (e.g., cholelithiasis severity)
- Do **not** recommend approval or rejection
- Explicitly mention uncertainty if image quality is poor
- All fields must be populated (use “Not assessed / Not seen” where needed)
